

Danafilms Opens Door to Greater Versatility

With 35 years of experience perfecting monolayer films, Danafilms has crossed the threshold into successfully producing co-extruded barrier films. By acquiring the capability to offer a full-range of options, Danafilms has proven why converters and end-users alike increasingly rely on its premium product.

“Our interest is to consistently exceed our customers’ expectations so we looked to acquire the versatility to handle a complete product line,” says Alan Simoncini, Danafilm’s General Manager. “The investment in W&H’s 7-layer VAREX® blown film line continues our quest to offer the most advanced technology. Our customers will benefit from our new capability to create 3-, 5- and 7-layer films with barrier to oxygen, moisture and aroma, as well as thermoformability and puncture resistance.”

Danafilm’s new VAREX® system produces

superior quality blown film 87 inches wide and up to 47 inches in diameter. It includes a multiple component gravimetric control system, Module ISP® for integrated quality control, and W&H’s OPTIFIL® P2 automatic die control with Beta thickness gauge to ensure the best film flatness possible.
